HTML5 vs.NET It's hard to compare the two, but there is one clear leader: HTML5. Here's a quick overview of the two contenders in this world of Web applications. HTML5: The Next Decade I'd be fine with Google buying out Microsoft, but we'll never get there. The web is struggling. Think about that. The web is trying to turn into a strong competitor of the Windows operating system, and I don't see that happening. I mean, the web didn't have a first-party-gaming license at the end of the last decade. It didn't have a stock market browser. HTML5 has some serious advantages. The main one is that it's growing rapidly. Even if HTML5 is going to become the new Windows, it's going to be hard for Microsoft to keep up with the pace of innovation. The next decade will be a decade of hot technology. Internet applications will be more powerful and powerful. It might be hard for Microsoft to focus on all of this. It might be hard for Microsoft to keep up with all of these innovations, so maybe the only sensible thing to do is to let Google buy them up. HTML5: The Future It's impossible for a single company to cover every single update, but Microsoft has already shown with Windows Phone and IE 10 that it's not the only game in town. There are millions of developers writing HTML5 code, and they're going to keep innovating. It's impossible for Microsoft to keep up with everything. The best thing to do is to just give up and let Google step in. HTML5: The Competitor HTML5 isn't a good Windows operating system. However, HTML5 is becoming powerful. It's growing rapidly and it'll be even more powerful in the next decade 09e8f5149f

SINGLE FILE JAR UPDATE PROGRAM Call me weird, but for some reason, it's getting harder and harder to have a clean and comfortable OS environment. Not only do I have to reinstall my whole system because of some stupid malware and viruses, but many applications have gotten really bloated and bloated and slow. One of my pet peeves is that many programs have single file.jar updates, and these update processes can be really slow and time-consuming. My advice is to keep your software up-to-date, clean, and free of unnecessary clutter. What is a.jar file anyway? JAR files are Java Archives, which is basically a.zip file format that comes with a proprietary extension and contains compiled Java source files. Many Java programs need to be downloaded and installed in your system, and the usual method is to have a single file.jar file, which is a special file that helps keep your system clean and executable. Why it can be a pain in the ass I'll start by saying that I
